PROFILE

Software Engineer focused on hybrid mobile apps (Vue + Capacitor) with native Android/iOS plugin experience. Cut cold-start time to home screen from 16s to 1.2s and overall load time by ~35% on a trading app with 100k+ users. Previously at SAP across support, QA and development roles.

EXPERIENCE

Software Engineer – Mobile Developer, Nelogica – Porto Alegre, RS — Sep 2025 – Present

- **Improved update performance:** moved bundle cleanup during updates to a separate worker thread, cutting cold-start time to the home screen from 16s to ~1.2s for 100k+ users.
- **Improved app performance:** applied critical, deferred and lazy loading, upgraded dependencies and implemented GPU-friendly animations, reducing app load time by ~35%.
- **Built Cloud Automation into Profit Mobile end-to-end:** contributed from flow design to launch, building the screens and backend integration modules that let traders deploy and manage strategy bots running server-side, so they no longer need the desktop app open to automate their portfolios. Tested the API from early development through release.
- **Revamped navigation UI:** rebuilt the navigation bar with an iOS Liquid Glass–style effect and gesture support, working closely with the UX team.
- **Refactored legacy code:** migrated legacy Vue components to current design patterns and built shared components and logic to speed up development and improve reuse.
- **Ported desktop features to mobile:** brought Currency Ranking and Favorite Assets selection from the desktop platform to the new hybrid mobile app.
- **Built native tooling and observability:** developed Capacitor plugins for Android and iOS to measure WebView load time per release, created OpenSearch dashboards to track product usage, and added a Capacitor config to disable OTA updates in test builds so QA builds aren't overwritten.

Software Engineering Intern (Rotation Program), SAP – São Leopoldo, RS — Mar 2023 – Mar 2025

Rotated through Support (Commerce Cloud), QA and Development (Intelligent Agriculture)

- **Development:** maintained and fixed bugs in farm logistics management features in a Scrum team.
- **QA automation:** built E2E tests with Selenium WebDriver and an automated test-data seeding solution that eliminated recurring failures in the deployment pipeline.
- **Enterprise support:** resolved 20+ tickets/month from large clients in several countries.

EDUCATION

UFRGS – Bachelor's degree in Physics Engineering — 2017 – Expected 2027

IFSC – Technical course in Mechatronics — 2014 – 2016

SKILLS

Programming Languages: TypeScript/JavaScript, HTML/CSS, SQL, Java/Kotlin (Jetpack Compose), Swift (iOS)

Libraries & Frameworks: Vue, React, Capacitor, Tailwind, Selenium WebDriver

Tools & Practices: Git (GitLab, GitHub), OpenSearch, Scrum

Languages: Portuguese (native), English (fluent), Spanish (intermediate)
